Task 3: Written answers — DRAFT

Darsh Jaiswal | 6/15 AI answers captured; remaining evidence pending browser access.

3a. A silent bug

The database's leads_source_check permits only seven tool names. It omits battle_card_generator and case_study_generator, so these inserts fail with PostgreSQL check-constraint error 23514. postToZohoForm() runs first without being awaited, independently of the database write. The Supabase failure is only logged; returning data?.id gives the caller undefined, so the later session save cannot link to a real lead while the interface may still show success.

I would add the two missing source values in a versioned migration, keeping the existing seven. The frontend, API validation and database must share the same source contract, including linkedin_hook_grader when the tenth tool ships. I would validate input, save the lead and its tool session together in a database transaction, and fail visibly unless both commit. That transaction would also create a durable CRM-sync job. A worker would await the Zoho response, record its outcome and retry temporary failures with an idempotency key. A database transaction cannot make an external Zoho request atomic.

To prevent recurrence, I would test every allowed source, a rejected unknown source, database failures and CRM retries; alert on persistent insert/sync errors; and reconcile completed tool runs against Supabase sessions and CRM records by source and session ID. I would recover missing sessions from retained request/execution logs where available, preserving original IDs and timestamps, and label unrecoverable inputs/outputs instead of inventing them. I would not blindly replay CRM submissions and create duplicate contacts.

3b. First three website changes (provisional)

1. Improve existing founder-branding, SaaS cold-email and exporter pages with short question-matched answers, clear service scope and links to the relevant case studies. Why: Gemini omitted Myntmore for Q2?Q4 while listing specialist providers. Those pages already exist; improve their specific, sourceable answers instead of creating duplicate pages. Helps: Q2, Q3, Q4.

2. If this is a client service Myntmore offers, add a Zoho-specific automation walkthrough linked from AI Lead Generation, with a redacted example, integration flow and failure/retry ownership. Why: Gemini Q5 named implementation providers with explicit Zoho pages. The current AI Lead Generation page does not mention Zoho. Helps: Q5.

3. Strengthen existing case-study proof with dates, baselines, client-approved attribution or independent verification, and connect it to the buyer guide and service pages. Why: Q1 and Q3 relied on directories/competitor roundups. The current founder case study uses an anonymous client description; more checkable evidence could support citation. Helps: Q1, Q2, Q3, Q4.

AI-search table and original screenshots are separate evidence. Finalise the recommendations after all 15 runs. No production website or database was modified.
