Darsh Jaiswal – Systems & AI Automation Intern (Round 2)

Myntmore | Completed written submission | 31 October 2026

Filled copy of the supplied assignment. Both Loom video links are included in the Submission table.

Before You Begin

Please fill in the details below:

Name: Darsh Jaiswal

Email: darshjaiswal1121@gmail.com

Tool choices: n8n for automation and Claude/Anthropic for AI. These replace the Gemini/Make references retained in the original questions. Codex assisted implementation; fixed code controls scores, routing and validation.

Live Hook Grader: https://myntmore-hook-grader-darsh.vercel.app

GitHub repository: https://github.com/darsh-jaiswal/Automation-Intern

Evidence note: the 11 supplied images are earlier implementation explanations, not new live-run screenshots. Original browser captures and verification records are linked below. Task 1 counts refer to the original sample verification; later tool demos added records. No email or external message was sent.

Guidelines

- **Use our stack:** build with the tools listed below, the same ones our team uses every day.
- **Think like an operator:** handle messy data and failures on purpose, not just the happy path.
- **Drafts only:** never send an email or message to a real person.
- **Keep secrets safe:** no API keys or passwords in your repo, screenshots or video.

About Myntmore: Read This First

Myntmore is a B2B growth marketing and AI-led outbound agency based in Mumbai. We help founders, CXOs, and expert-led businesses turn LinkedIn into a predictable engine for qualified sales meetings.

This round is about the system behind our lead magnets: 9 free AI tools on our website. A visitor fills a short form and uses a tool, and each session is saved as one row: who they are, what they typed, and what the tool returned. Sales then tries to book a call through myntmore.com/founder-meeting.

Resources: Review Before Starting

Website: https://myntmore.com

Free AI tools: https://www.myntmore.com/resources/tools

Product Video: https://www.loom.com/share/143c7b6ae41242bbbad797539987d214

Services Doc: https://myntmoreservices.notion.site/Myntmore-Growth-Marketing-Services-26b522641d388077a463e86ae78f02bc

Sample data: leads.csv, attached to the email (20 fictional tool sessions)

The Stack: Use These

For	Use
Automation	Make, Zapier, n8n, etc.
AI	Google Gemini (gemini-2.5-flash), with a free API key from Google AI Studio
Database	Supabase
Web app	Next.js, code on GitHub, deployed on Vercel
Video	Loom

Free plans are enough. AI coding assistants such as Claude Code / Codex are fine, as long as you can explain what you built.

The Assignment: 3 Tasks

01) Build the Lead Follow-Up Engine (main task)

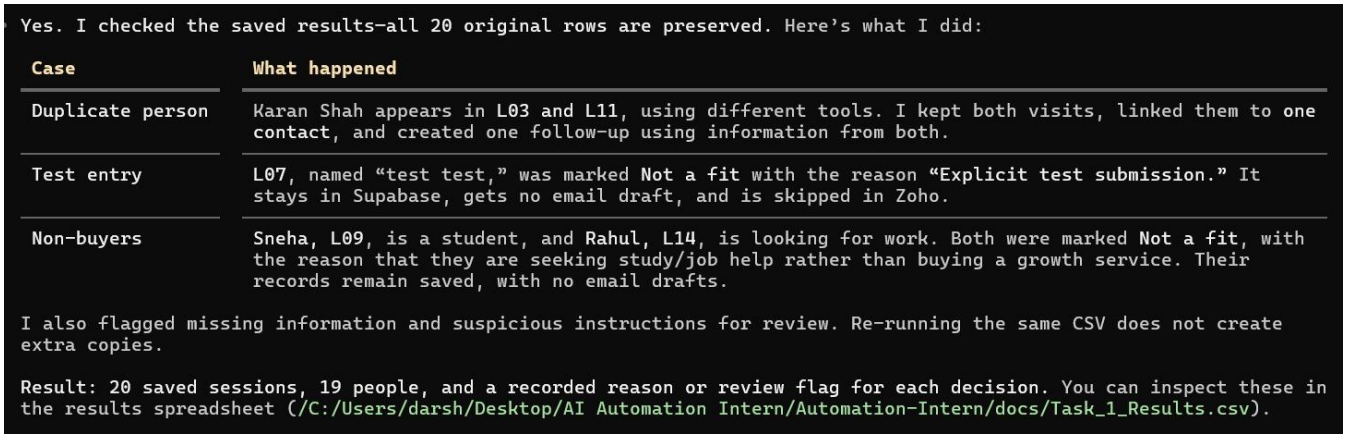

Import **leads.csv** into a Supabase table. It holds 20 fictional tool sessions, and some rows are messy on purpose. Then build an automation using Make, Zapier, n8n:

Answer: The manual n8n workflow starts at “Run sample CSV”, then “Import every original session”. The local worker parses the repository’s leads.csv and stores all 20 original sessions in Supabase before grouping them into 19 contacts. It then processes each person, validates the draft and saves CRM text. Replaying unchanged data preserves session, contact, assessment, draft and alert identities.

- **Cleans the data.** Handle duplicates, test entries and non-buyers on purpose, and record a reason. Never drop a row silently.

Answer: All 20 raw rows are retained. Karan Shah’s L03 and L11 sessions are linked to one person and used together. L07 is an explicit test; L09 is a student and L14 is a job seeker. They remain saved with a reason and receive no draft. Missing context/email and suspicious instructions are visible review holds. Different people at one company remain separate; a personal email address alone is not an exclusion.

Screenshot 11: Task 1 / duplicates, test entries and non-buyers. Candidate-supplied implementation explanation.

Yes. I checked the saved results—all 20 original rows are preserved. Here’s what I did:

Case	What happened
Duplicate person	Karan Shah appears in **L03** and **L11**, using different tools. I kept both visits, linked them to one contact, and created one follow-up using information from both.
Test entry	**L07**, named “test test,” was marked **Not a fit** with the reason **“Explicit test submission.”** It stays in Supabase, gets no email draft, and is skipped in Zoho.
Non-buyers	**Sneha, L09**, is a student, and **Rahul, L14**, is looking for work. Both were marked **Not a fit**, with the reason that they are seeking study/job help rather than buying a growth service. Their records remain saved, with no email drafts.

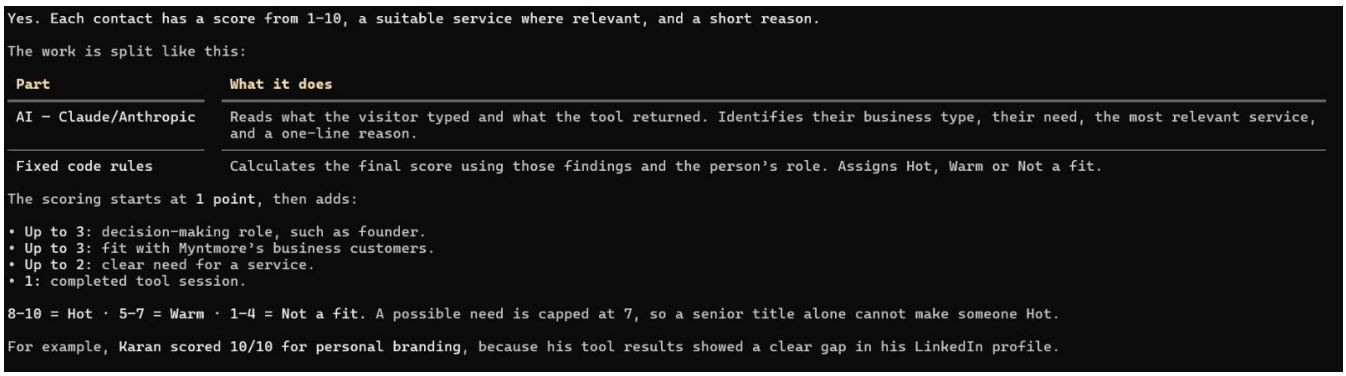

I also flagged missing information and suspicious instructions for review. Re-running the same CSV does not create extra copies.

Result: 20 saved sessions, 19 people, and a recorded reason or review flag for each decision. You can inspect these in the results spreadsheet (/C:/Users/darsh/Desktop/AI Automation Intern/Automation-Intern/docs/Task_1_Results.csv).

- **Scores each lead** from 1 to 10 for fit with one of our services (personal branding, LinkedIn outreach, cold email, lead generation), with a one-line reason. Say which parts are rules and which are Gemini.

Answer: Each contact receives a final score from 1–10, a relevant service where supported, and a one-line reason. Claude interprets the business, need and suitable service using the saved input and output. Code adds the points, applies caps and assigns the tier. The full rubric is filled in the scoring box below.

Screenshot 9: Task 1 / lead scoring. Candidate-supplied implementation explanation.

Yes. Each contact has a score from 1–10, a suitable service where relevant, and a short reason.

The work is split like this:

Part	What it does
AI – Claude/Anthropic	Reads what the visitor typed and what the tool returned. Identifies their business type, their need, the most relevant service, and a one-line reason.
Fixed code rules	Calculates the final score using those findings and the person’s role. Assigns Hot, Warm or Not a fit.

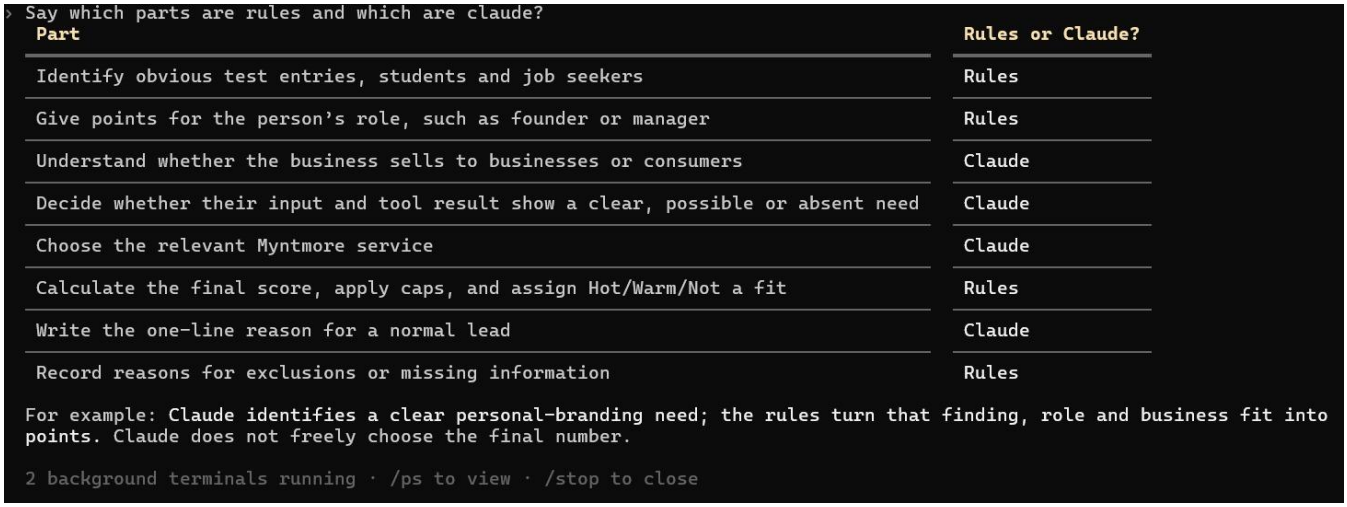

The scoring starts at **1 point**, then adds:

- **Up to 3**: decision-making role, such as founder.
- **Up to 3**: fit with Myntmore’s business customers.
- **Up to 2**: clear need for a service.
- **1**: completed tool session.

8–10 = Hot · 5–7 = Warm · 1–4 = Not a fit. A possible need is capped at 7, so a senior title alone cannot make someone Hot.

For example, **Karan scored 10/10 for personal branding**, because his tool results showed a clear gap in his LinkedIn profile.

Screenshot 10: Task 1 / rules versus Claude. Candidate-supplied implementation explanation.

› Say which parts are rules and which are claude?

Part	Rules or Claude?
Identify obvious test entries, students and job seekers	Rules
Give points for the person's role, such as founder or manager	Rules
Understand whether the business sells to businesses or consumers	Claude
Decide whether their input and tool result show a clear, possible or absent need	Claude
Choose the relevant Myntmore service	Claude
Calculate the final score, apply caps, and assign Hot/Warm/Not a fit	Rules
Write the one-line reason for a normal lead	Claude
Record reasons for exclusions or missing information	Rules

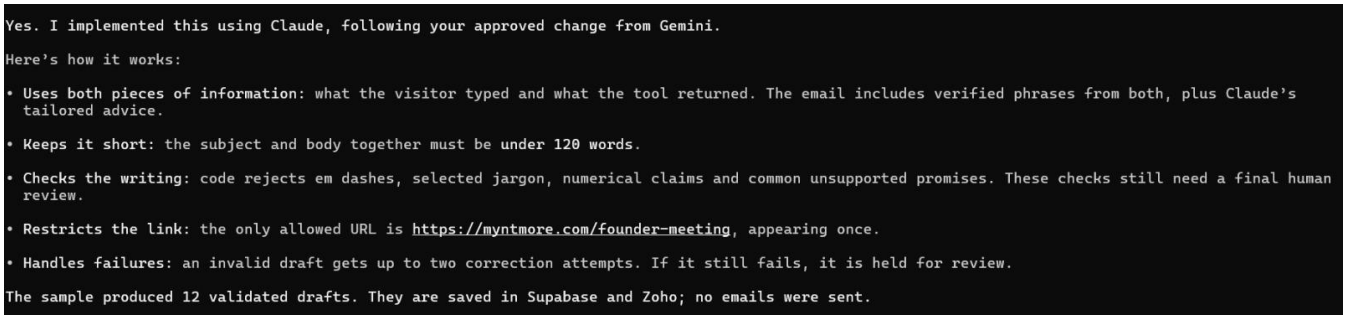

For example: Claude identifies a clear personal-branding need; the rules turn that finding, role and business fit into points. Claude does not freely choose the final number.

2 background terminals running · /ps to view · /stop to close

- **Writes a follow-up email** with Gemini that uses what the lead typed and what the tool returned. No jargon or em dashes, no invented numbers or claims, under 120 words, and only myntmore.com/founder-meeting as the call link.

Answer: Claude writes a context-based subject, advice and invitation using both the visitor's input and the tool output. Code assembles and checks the draft: subject and body together under 120 words; verified source phrases from both inputs; no selected jargon, em/en dashes or numerical performance claims; only https://myntmore.com/founder-meeting, once. Up to two correction attempts follow the initial attempt, then the result is held for review. These checks still need human review. The original sample produced 12 validated drafts, saved in Supabase and Zoho lead Description; nothing was sent.

Screenshot 8: Task 1 / email writing checks. Candidate-supplied implementation explanation.

Yes. I implemented this using Claude, following your approved change from Gemini.

Here's how it works:

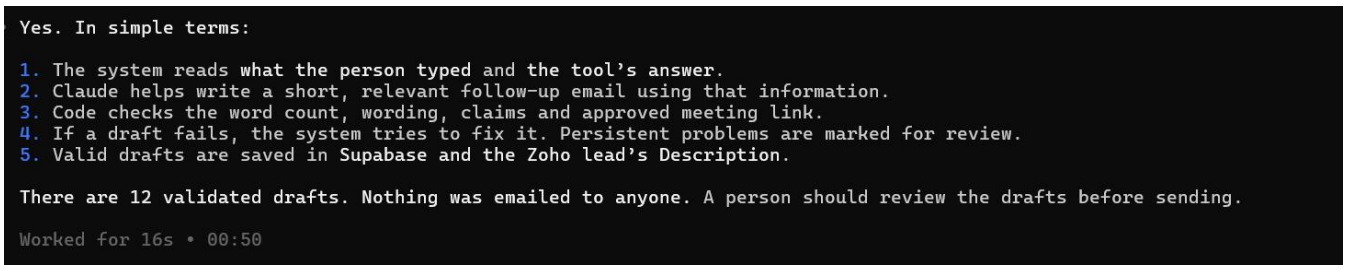

- **Uses both pieces of information:** what the visitor typed and what the tool returned. The email includes verified phrases from both, plus Claude's tailored advice.
- **Keeps it short:** the subject and body together must be under 120 words.
- **Checks the writing:** code rejects em dashes, selected jargon, numerical claims and common unsupported promises. These checks still need a final human review.
- **Restricts the link:** the only allowed URL is https://myntmore.com/founder-meeting, appearing once.
- **Handles failures:** an invalid draft gets up to two correction attempts. If it still fails, it is held for review.

The sample produced 12 validated drafts. They are saved in Supabase and Zoho; no emails were sent.

- **Routes each lead:** Hot (draft email plus an alert), Warm (one nurture email drafted) or Not a fit (tagged with the reason, no email).

Answer: Code routes 8–10 to Hot, 5–7 to Warm and 1–4 to Not a fit. Hot gets a validated draft plus an internal database/dashboard alert and Zoho priority marker; Warm gets one validated nurture draft. Not a fit keeps the reason and gets no draft. Review/error states hold unsafe drafts. Original sample verification: 1 Hot, 13 Warm, 5 Not a fit, 12 validated drafts, 4 review holds, zero processing errors, 17 contacts synced and read back from Zoho. The test record and missing-email record were intentionally skipped in CRM. Zoho stores draft text in Description, rather than a native email draft.

Screenshot 7: Task 1 / routing and follow-up draft summary. Candidate-supplied implementation explanation.

Yes. In simple terms:

1. The system reads what the person typed and the tool's answer.
2. Claude helps write a short, relevant follow-up email using that information.
3. Code checks the word count, wording, claims and approved meeting link.
4. If a draft fails, the system tries to fix it. Persistent problems are marked for review.
5. Valid drafts are saved in Supabase and the Zoho lead's Description.

There are 12 validated drafts. Nothing was emailed to anyone. A person should review the drafts before sending.

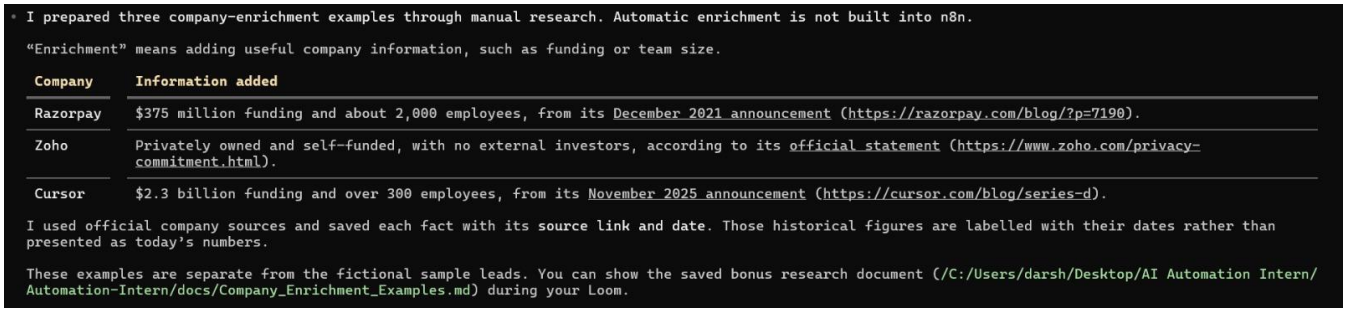

Worked for 16s • 00:50

Bonus: enrich leads with company size, funding or LinkedIn activity. Show it on 3 real companies, since the sample people are fictional.

[Full sourced enrichment examples]

Answer: I manually researched three real companies, separately from the fictional sample people. Razorpay: $375 million funding and about 2,000 employees in its December 2021 announcement. Zoho: privately owned and self-funded, per its official statement. Cursor: $2.3 billion funding and over 300 employees in its November 2025 announcement. Each fact has its first-party source and date. These are dated examples, not current size estimates; automatic enrichment is not implemented.

Screenshot 6: Task 1 / three manual enrichment examples. Candidate-supplied implementation explanation.

I prepared three company-enrichment examples through manual research. Automatic enrichment is not built into n8n.

"Enrichment" means adding useful company information, such as funding or team size.

Company	Information added
Razorpay	$375 million funding and about 2,000 employees, from its December 2021 announcement (https://razorpay.com/blog/?p=7190).
Zoho	Privately owned and self-funded, with no external investors, according to its official statement (https://www.zoho.com/privacy-commitment.html).
Cursor	$2.3 billion funding and over 300 employees, from its November 2025 announcement (https://cursor.com/blog/series-d).

I used official company sources and saved each fact with its **source link and date**. Those historical figures are labelled with their dates rather than presented as today's numbers.

These examples are separate from the fictional sample leads. You can show the saved bonus research document (/C:/Users/darsh/Desktop/AI Automation Intern/Automation-Intern/docs/Company_Enrichment_Examples.md) during your Loom.

Your scoring rules, and which parts are rules vs Gemini (implemented with Claude):

Final score = 1 base point + role (0–3) + business fit (0–3) + relevant need (0–2) + completed tool activity (0–1). Founders/decision makers can earn up to 3 role points; B2B fit up to 3; clear need 2 or possible need 1.

Caps: possible/adjacent need or consumer-facing context cannot exceed 7; no evidenced relevant need cannot exceed 4. Explicit test/job-seeker exclusions receive 1 and no draft. Missing data, suspicious input or failed analysis is flagged for review.

Rules: preserve and group sessions, exclusions, role points, arithmetic/caps, Hot/Warm/Not a fit, draft checks, retries, storage and CRM deduplication. Claude: interpret business type and input/output need, select a service, provide supporting evidence and the normal lead's one-line reason, and write the draft content.

Hot 8–10; Warm 5–7; Not a fit 1–4. A senior title alone cannot make a weak-fit lead Hot. Example: Karan's two sessions support a personal-branding need; his final score was 10. These rules are design choices, not a measured sales-conversion predictor.

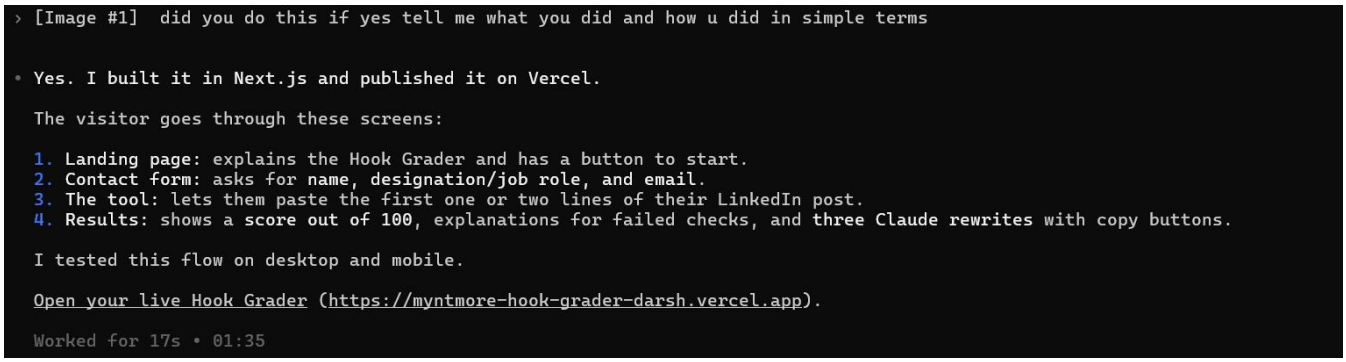

02) Ship a 10th Free Tool: the LinkedIn Hook Grader

A visitor pastes the first two lines of a LinkedIn post and gets a score and 3 rewrites. Try our LinkedIn Profile Optimizer first to see the pattern.

- **Build it in Next.js on Vercel:** a landing screen, a contact form (name, designation, email), the tool, then the results.

Answer: Built in Next.js and deployed at the live URL above. The visitor sees a landing page, enters name/designation/email and accepts the storage notice, pastes one or two hook lines, then sees a score, failed-check feedback and three rewrites with Copy buttons. Desktop and mobile production checks are recorded.

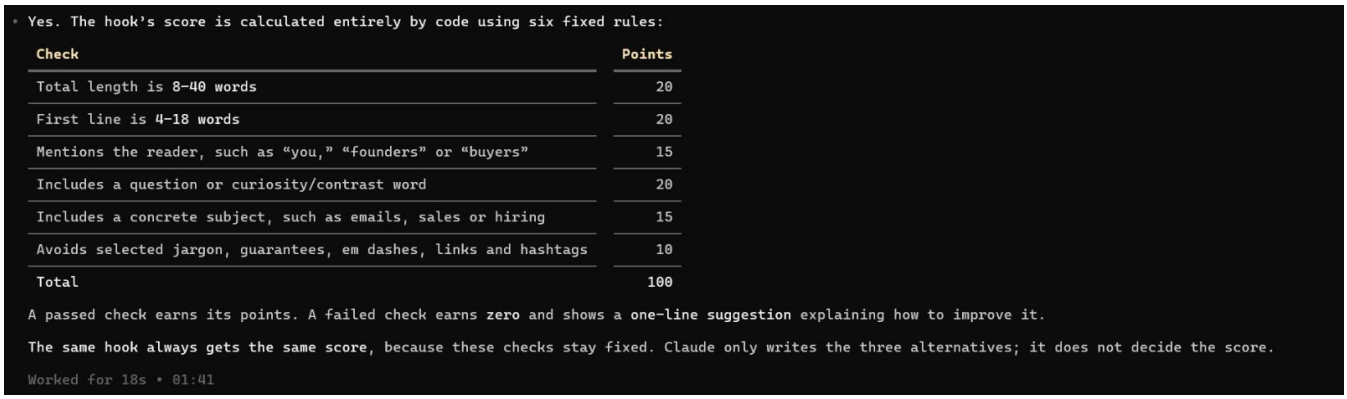

Screenshot 1: Task 2 / visitor flow and Vercel deployment. Candidate-supplied implementation explanation.

- **Score the hook with code, not AI:** 4 to 6 rules, a score out of 100, and one line for each rule that fails. The same hook always gets the same score.

Answer: The same normalised hook always receives the same score. Six code rules total 100 points: 8–40 words (20); first line 4–18 words (20); reader focus (15); question/curiosity/contrast (20); concrete subject/example (15); plain wording without selected jargon, guarantees, em/en dashes, links or hashtags (10). Each rule passes for its full points or fails for zero with one line of feedback. Claude does not decide the score. This is a writing checklist, not a prediction of post reach.

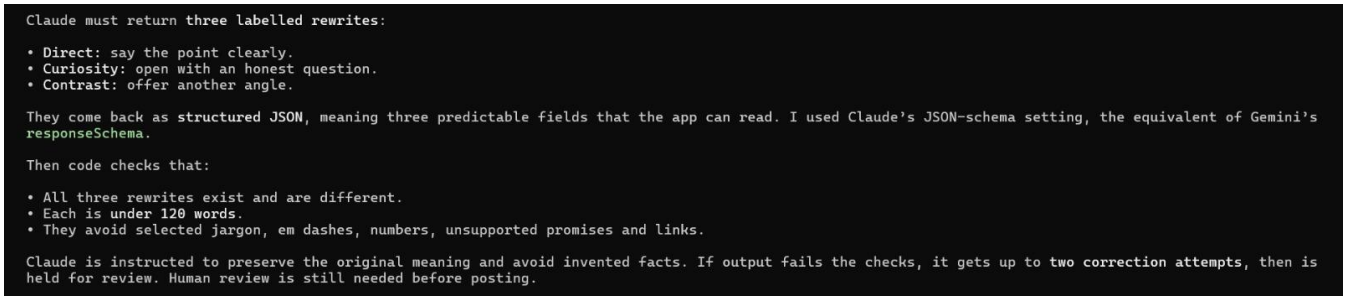

Screenshot 2: Task 2 / six fixed scoring rules. Candidate-supplied implementation explanation.

- **Get 3 rewrites from Gemini** as structured JSON (responseSchema), following the Task 01 writing rules.

Answer: Claude returns JSON with exactly direct, curiosity and contrast fields using its JSON-schema structured-output setting. Code checks that all three rewrites exist, differ, stay within one/two lines and under 120 words, and avoid selected jargon, dashes, added numbers, unsupported generalisations and links. The prompt requires preserved meaning and no invented facts. Failed output gets up to two corrections, then a visible review/error state. Hook rewrites contain no call link; the approved booking link is added only to the separate Task 1 follow-up.

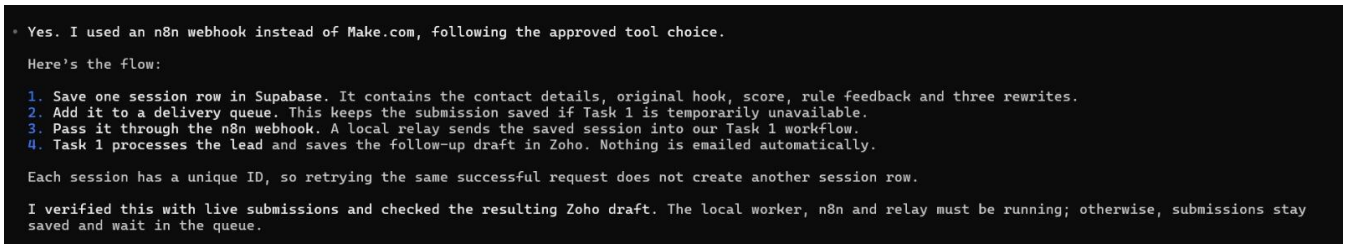

Screenshot 3: Task 2 / structured rewrites and validation. Candidate-supplied implementation explanation.

- **Save each session** (contact, hook, score, rewrites) as one row in Supabase, and send it to your Task 01 scenario through a Make.com webhook.

Answer: One request UUID identifies one Supabase session row containing contact details, original hook, code score, rule feedback and rewrites/model status. Failures remain recorded. A durable Supabase delivery queue lets the local relay send the saved session to the authenticated n8n Task 1 webhook. Task 1 processes the lead and stores the follow-up in Zoho Description. Successful replays do not create another session row. The worker, n8n and relay must be running; otherwise delivery waits in the saved queue. Live browser-to-Supabase-to-n8n-to-Zoho read-back was verified.

Screenshot 4: Task 2 / saved session and n8n delivery. Candidate-supplied implementation explanation.

One plain page is enough.

Task 2 production verification record

Original desktop and mobile browser screenshots

03) Ops Judgement (written, 1 page max)

Answer each question in the space below it.

Task 3's written answer is also supplied as a one-page PDF. The detailed 15-row comparison and screenshot evidence are an appendix, as the supplied table already spans multiple pages.

Task 3: one-page written answer

3a. A silent bug

Leads from the Battle Card and Case Study tools reach Zoho CRM, but Supabase has none of their sessions. The other 7 tools are fine. What is wrong, how do you fix it, and how do you stop it from failing silently again?

```
constraint leads_source_check check (source in (
  'roi_calculator', 'icp_builder', 'profile_optimizer',
  'dm_angle_generator', 'lead_magnet_ideas',
  'posting_rhythm_builder', 'founder_presence_analyzer'
))

async function saveLead(source: LeadSource, lead: LeadForm) {
  postToZohoForm(source, lead);
  const { data, error } = await supabase
    .from("leads").insert({ source, ...lead }).select().single();
  if (error) console.error("lead insert failed", error);
  return data?.id; // later used to save the tool's inputs and outputs
}
```

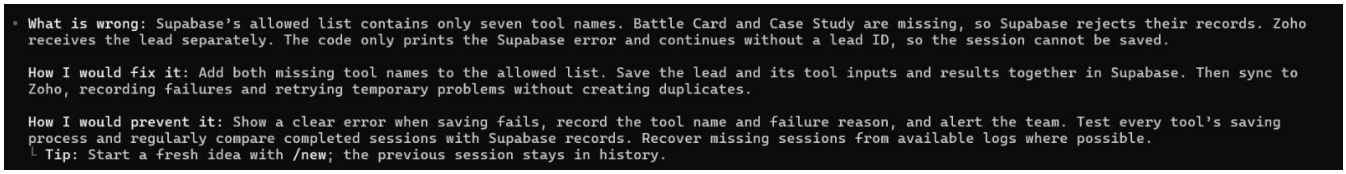

Your answer:

What is wrong: leads_source_check allows only seven source names. Battle Card and Case Study are missing, so their database inserts fail (PostgreSQL 23514). Zoho is called independently before the database write and is not awaited. The error is only logged; returning data?.id leaves no lead ID for the session save.

Fix: confirm the emitted source IDs and add the missing values in a versioned migration, preserving the existing seven. Keep frontend/API/database source lists aligned, including the tenth tool. Save the lead, session and durable CRM-sync job in one database transaction. Show failure unless the database work commits. Then a worker awaits Zoho, records the result and retries temporary failures with an idempotency key. A database transaction cannot make a Zoho HTTP request atomic.

Prevent recurrence: test all sources, unknown sources, insert failures and CRM retries. Alert on persistent failures and compare completed runs with database sessions and CRM records by source/session ID. Recover missing sessions from retained logs with original IDs/timestamps where possible; label unrecoverable data and avoid blind CRM replay. This is an analysis of the supplied snippet, not a production schema change.

Screenshot 5: Task 3a / bug diagnosis, fix and prevention. Candidate-supplied implementation explanation.

3b. AI search

Ask ChatGPT, Perplexity and Gemini 5 questions a potential client would ask. Does Myntmore appear, and who appears instead? Name the 3 website changes you would make first.

Answer: All 15 real answers were collected on 31 October 2026 IST, using the same five neutral prompts in fresh conversations. Myntmore appeared in 4/15: Q1 ChatGPT #2, Perplexity #1 and Gemini #1; Q3 Perplexity #4. It was absent from all Q2, Q4 and Q5 answers. ChatGPT was signed-in Instant (Plus); Gemini signed-out Flash-Lite; Perplexity Q1 signed out and Q2–Q5 signed in on Free, with an automatic Pro preview on Q2. These differences limit comparison. Positions are answer order, not stable rankings. AI claims and URLs are preserved, including errors; citation-chip targets were not all expanded.

Results

#	AI	Question asked	Does Myntmore appear? (Yes/No, position)	Who appears instead	What the answer said (1 line)	Sources the AI cited	Screenshot
1	ChatGPT	Which agencies in Mumbai help B2B founders get qualified sales meetings through LinkedIn outreach? Your 3 website changes

#	Website change	Why (what you saw in the answers above)	Which questions it would help
1	Improve existing founder-branding, SaaS cold-email and exporter pages with concise buyer-question answers, clear deliverables and relevant case-study links.	Myntmore was absent from all three Q2 and Q4 answers. Specialist providers had more explicit service or founder-profile evidence.	Q2, Q3, Q4
2	If Zoho automation is offered to clients, publish a Zoho-specific implementation walkthrough with a redacted lead-to-CRM flow and retry ownership.	All three Q5 answers favoured explicit Zoho providers. The checked AI Lead Generation page does not mention Zoho.	Q5
3	Strengthen case studies with dates, baselines and client-approved attribution or independent references, linked from service pages and the buyer guide.	ChatGPT and Perplexity repeatedly distinguished advertised capabilities from verified results. The checked founder case study uses an anonymous client description.	Q1, Q2, Q3, Q4, Q5

Walk Us Through It on a Loom

Record one video, 5 to 7 minutes long, with your camera on. Show us these four things, in this order:

1. **Your follow-up engine (Task 01) working:** run it on leads.csv and show the results in Zoho CRM.
2. **Your Hook Grader (Task 02) working:** use it like a visitor would
3. **How you built it:** walk through your automation. Point out which steps follow fixed rules you wrote and which steps use Gemini.
4. **What's missing:** what doesn't work yet, and what you would fix next with more time.

Clear and honest beats polished. We want to hear what you think.

What We Are Actually Evaluating

- **It works end to end (25%):** Task 01 on the sample leads, and a Task 02 lead flowing through it
- **Follow-up quality (15%):** personal, and following the writing rules
- **Built to reuse (15%):** easy to add a tool or a rule, and failures are visible
- **The Hook Grader (15%):** deployed, a consistent score, structured AI output
- **Messy data (10%):** every odd row handled on purpose
- **Judgement (10%):** your Task 03 answers
- **Initiative and communication (10%):** going beyond the brief, and explaining it simply

One Thing Before You Start

Open leads.csv and read every row before you build anything. Real form data is messy, and how you handle the odd rows will tell us more than how polished your workflow looks.

Submission

- Submission name: Darsh Jaiswal – Systems & AI Automation Intern (Round 2)
- Fill in your links in the table below
- Ensure all Drive links are set to Anyone with the link can view
- Save as PDF and reply to the same email thread with the attached file

Submission status: written answers, evidence and both candidate-supplied Loom video links are included. No candidate Drive link is used here. The original resource video above belongs to the assignment and is separate from my two Loom videos in the table below. Attach this PDF when replying to the original email thread.

Limitations: local worker/n8n/relay require this computer to remain online. Production hosting for them, automatic enrichment and stronger abuse protection are future work. AI drafts and semantic claims need human review. Code supports a Gemini option in Task 1, but the verified runs and Hook Grader use Claude. No email or message was sent.

Task 1 results: 20 original sessions and recorded decisions

Task 1 verification, recorded 30 October 2026

Task 2 live verification

Task 3 original answers, sources, dates and all captures

Public-release security check
